The most powerful and affordable bathroom shower in the world

The amount of water available for each of us is decreasing every year and if we add the effects of degradation, pollution and waste of this precious resource, the situation is growing ever more serious.

Xenz Beterbad from Dronten in the Netherlands is responding to this demand by developing a sustainable solution with the UPFALL Shower. The UPFALL water shower is an ingenious solution in which a comfortable and powerful waterfall with more than 30 liters per minute is obtained, with only 1.5 liters of water consumption per minute.

This represents exceptional water savings thanks to their exclusive Upcycle system, where the water used is collected, filtered, sanitized, heated and then pumped again. Shower for hours without feeling guilty about using too much water!

RPE is pleased to participate in this ambitious "water recycling" shower project with our R MINI 4110 DCD12V40 (3/8" F) and the 5110DNC1240V (1/2" M) Solenoid Valves, an integral part of this system and other similar projects soon to be launched.

RPE is proud to have participated in this project and appreciates the support from everyone involved at the different stages and levels.

That's how the Upfall works

The power of a rain shower with a consumption of only 1.5 liters of water per minute. Clean and durable in just a few steps.

- The small reservoir fills with water.
- The water is drawn up from the reservoir.
- A microfilter prevents hair and dirt.
- A pump pushes the water "UP"
- The UV filter cleans the water.
- Warm water is added to change the water and keep it at the right temperature.
- Enjoy wonderful wide "FALL" from the large overhead shower
